Overboard Alarm System is an intelligent alarm device designed for water safety. It usually consists of three parts: a water sensor, an alarm device, and a monitoring center. The system can monitor the water environment in real time. When a person or object is detected falling into the water, the water sensor will quickly generate an alarm signal. After receiving the signal, the alarm device will immediately trigger the alarm and send the alarm information and the location information of the person who fell into the water to the monitoring center through wireless communication. After receiving the information, the monitoring center can quickly and accurately locate the person who fell into the water and organize rescue operations in a timely manner.
