## Abstracts

According to this study, the global Overexpression Stable Cell Lines Service market size will reach US\$ 315 million by 2031.

Overexpression Stable Cell Line Service is a specialized biotechnology service aimed at constructing a population of transgenic cells capable of expressing a target gene or protein at a consistently high level over an extended period of time. The process typically involves introducing the target gene into a host cell (e.g. mammalian, bacterial or insect cells) using a viral vector or plasmid, followed by screening and cloning to isolate cells that stably integrate the transgene into their genome. The resulting stable cell lines are genetically engineered to maintain stable gene expression without significant loss of function over multiple passages, which is critical for research (e.g., studying protein function, drug screening) and bioproduction (e.g., production of recombinant proteins, antibodies). By ensuring reliable and sustained overexpression, these services enable scientists to overcome the limitations of transient transfection methods and provide a stable platform for downstream applications requiring sustained protein production or long-term cellular modeling.
