The global Overfrequency Ultrasonic Generator market size is predicted to grow from US$ 81.8 million in 2025 to US$ 111 million in 2031; it is expected to grow at a CAGR of 5.3% from 2025 to 2031.

An overclocked ultrasonic generator is a device that converts mains electricity (usually 220V or 380V, 50Hz or 60Hz) into a high-frequency AC signal that matches the ultrasonic transducer. This high-frequency AC signal is used to drive the ultrasonic transducer to work, thereby generating ultrasonic vibrations. The working principle of the overclocked ultrasonic generator involves signal generation and amplification. First, a signal generator generates a signal of a specific frequency, which can be a sinusoidal signal or a pulse signal, and the frequency of the signal matches the resonant frequency of the ultrasonic transducer. Then, the signal is amplified by a power amplifier to generate a sufficiently strong drive signal to drive the ultrasonic transducer. After the transducer receives the high-frequency AC signal, it converts it into high-frequency mechanical vibrations to generate ultrasonic waves.
