The global Overhead Aluminium Conductors market size is predicted to grow from US\$ 442 million in 2025 to US\$ 571 million in 2031; it is expected to grow at a CAGR of 4.4% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Overhead Aluminium Conductors are types of electrical conductors used primarily in overhead power transmission and distribution lines. These conductors are made of aluminium or aluminium alloys, often reinforced with steel or other materials for added strength. They are widely used due to their light weight, good conductivity, and cost-effectiveness compared to copper.

In the power cable industry, the technical content of conventional products such as ordinary wires is not high, and the market access threshold is low, so that the entire industry has a large number of small-scale production enterprises with production capacity far greater than market demand, and market competition is fierce.

Aluminum conductors are cheaper than copper and have strong corrosion resistance, making them suitable for long-span installation (such as ACSR steel-core aluminum stranded wire). The electrification process in developing countries is accelerating, promoting the application of overhead aluminum conductors in power transmission (especially high-voltage and ultra-high-voltage lines). There is a significant demand for the transformation of old power grids. For example, the United States plans to replace copper conductors with aluminum conductors to reduce costs.

The Asia-Pacific region dominates the global overhead aluminum conductor market, mainly due to rapid urbanization, grid expansion and large-scale investment in renewable energy projects (such as wind power and solar energy) in countries such as China and India.
