Ovotransferrin is a glycoprotein of egg white albumen. It has a molecular weight of 76,000 daltons and contains about 700 amino acids. Ovotransferrin makes up approximately 13% of egg albumen (in contrast to ovalbumin, which comprises 54%). As a member of the transferrin and metalloproteinase family, ovotransferrin has been found to possess antibacterial and antioxidant and immunomodulatory properties, arising primarily through its iron (Fe<sup>3+</sup>) binding capacity by locking away a key biochemical component necessary for micro-organismal survival. Bacteria starved of iron are rendered incapable of moving, making ovotransferrin a potent bacteriostatic.
