The global Oxaziclomefone market size is predicted to grow from US\$ 159 million in 2025 to US\$ 278 million in 2032; it is expected to grow at a CAGR of 8.4% from 2026 to 2032.

Oxazinone is a new type of selective herbicide belonging to the isoxazine class of compounds, specifically used to control grass weeds, some broadleaf weeds, and sedges in rice fields. It achieves its herbicidal effect by inhibiting the growth and development of weeds, and is characterized by its long-lasting effect, ease of use, and high safety for crops. Furthermore, oxazinone degrades relatively quickly in the soil, minimizing its environmental impact, making it an environmentally friendly herbicide.

The oxazinone industry chain primarily consists of upstream key raw materials and intermediates (such as o-nitroanisole, acyl chloride, heterocyclic intermediates, etc.)?midstream raw material synthesis and formulation processing (which can be made into wettable powders, suspension concentrates, oil suspensions, microemulsions, etc.)?and downstream applications (weed control in fields of crops such as corn, sugarcane, and sorghum). The upstream segment requires high stability in fine chemical processes and strict environmental protection standards; the midstream segment has a high degree of production concentration, with domestic enterprises possessing competitive advantages in raw material costs and scale; the downstream segment is mainly driven by the demand for large-scale grain crop cultivation, with the end products primarily being formulated mixtures, and distribution channels including agricultural retailers, cooperatives, and overseas agricultural service systems. Overall, the gross profit margin is highest in the midstream raw material segment, followed by the formulation segment, with stable gross margins in the downstream channels; the overall industry capacity utilization rate is in the 70%-85% range, with leading companies maintaining higher levels under stable order conditions.

In 2024, the global production of oxazinone reached 604 ton, with an average selling price of US\$250 per kilogram.

Oxadiazon, as a selective pre- and post-emergence herbicide, has long maintained high market demand in crop systems such as corn due to its broad spectrum, stability, and good safety profile. It has a clear target site and strong compatibility, allowing it to form highly effective mixtures with herbicides such as nicosulfuron and atrazine, offering significant advantages in controlling resistant weeds and complex weed communities. In recent years, against the backdrop of expanding global corn planting areas, increasing pressure from herbicide-resistant weeds, and the growing need for crop cost control, oxadiazon continues to show robust demand. However, it is also affected by stricter regional pesticide regulations, an increase in green alternatives, and intensified competition from mixed formulations. Overall, oxadiazon is a mature but resilient agrochemical product, and its future growth will depend more on innovative formulations and expansion into overseas markets.
