The global Oxazolidine Latent Curing Agent market size is predicted to grow from US\$ 69.94 million in 2025 to US\$ 94.43 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

Oxazolidine latent curing agent is a functional additive primarily used in one-component moisture-curing polyurethane (PU) systems (such as sealants, coatings, and adhesives). It does not react with isocyanates in the dry state, but hydrolyzes upon contact with moisture in the air to generate hydroxyl and amino groups, thereby initiating curing. It effectively eliminates foam and acts as a reactive diluent to reduce system viscosity.

Upstream core raw materials include amino alcohols, aldehydes or ketones, as well as dehydrating agents and catalysts. The purity of the amino alcohol determines the conversion rate of the final product, while the choice of aldehyde/ketone directly affects the ring-opening rate and odor of the latent curing agent. Downstream applications are concentrated in one-component polyurethane (1K PU) products. Global sales in 2025 were approximately 5,500 tons, with an average selling price of \$13/kg. The industry gross profit margin is between 20% and 30%.
