An oxygen permeation analyzer is a specialized instrument used to measure the rate of oxygen transmission through various materials, such as films, coatings, and packaging materials. It helps determine the barrier properties of these materials against oxygen permeation. The analyzer typically consists of a test chamber with a sample holder where the material to be tested is placed. The sample is exposed to a controlled environment with a high concentration of oxygen on one side and a low or zero concentration of oxygen on the other side. The instrument then measures the rate at which oxygen molecules pass through the material over a specified period. By analyzing the oxygen transmission rate (OTR), manufacturers and researchers can assess the effectiveness of barrier materials and evaluate their suitability for applications such as food packaging, pharmaceuticals, and electronics. This helps ensure product quality, extend shelf life, and preserve sensitive contents from the harmful effects of oxygen exposure.
