## Abstracts

The global Oxygen Reduction Systems Door (ORS Door) market size is predicted to grow from US\$ 59.67 million in 2025 to US\$ 87.67 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

Oxygen Reduction Systems Door (ORS Door) is a specialized industrial barrier door customized for oxygen reduction systems ? environments where oxygen concentration is actively controlled below the combustion threshold (typically 12%-17% oxygen content) to achieve fire prevention without traditional fire suppression systems. It is engineered with high airtightness, flame-retardant performance and stable structural design, core functions including isolating the oxygen-reduced zone from external atmospheric environments to prevent air infiltration and maintain stable oxygen concentration inside the zone, while supporting normal material circulation and personnel access; equipped with matching sealing structures, safety protection components (obstacle detection, emergency release) and system linkage modules, it can coordinate with ORS equipment for real-time oxygen concentration monitoring and adaptive adjustment, ensuring the safe and stable operation of the oxygen reduction system.

In 2025, global Oxygen Reduction Systems Door (ORS Door) production reached approximately 14,878 units, with an average global market price of around US\$ 4,100 per unit. The production capacity of Oxygen Reduction Systems Door (ORS Door) is approximately 18 K units per year, the average gross profit margin was 28-31%.

The upstream supply chain of Oxygen Reduction Systems (ORS) Door includes suppliers providing structural materials such as metal profiles, PVC curtain, thermal insulation panels and airtight sealing strips, as well as manufacturers of core

electromechanical components like drive motors, control panels, oxygen-difference sensors, safety devices and guide rails; the midstream consists of door assembly enterprises integrating production, debugging and customization, while downstream products are delivered to end users including data centers, archives, warehouses, cultural relic sites and cold chain facilities through engineering contractors, system integrators and professional distributors, supported by after-sales maintenance and system upgrading service providers.

The cost composition of ORS Door is dominated by core electromechanical components including special motors, airtight control systems and oxygen monitoring sensors, which account for the largest proportion of total cost, followed by expenses for high-airtightness structural materials, sealing parts and profile processing, then manufacturing and assembly labor costs, on-site installation and commissioning fees, as well as R&D and certification costs for airtightness and safety performance, with a small share of logistics, packaging and after-sales reserve costs, and customized high-airtightness models further increasing material and R&D expenditure.
