The global Oxyhydroxide market size is predicted to grow from US\$ 5472 million in 2025 to US\$ 9098 million in 2032; it is expected to grow at a CAGR of 7.6% from 2026 to 2032.

Oxyhydroxides are a class of inorganic compounds with the general formula $M^+O(OH)_2$, where a metal (commonly Fe, Al, Mn, or Ni) is bonded to both oxide (O^{2-}) and hydroxide (OH^-) groups; typical examples include iron oxyhydroxides (FeOOH phases such as goethite and lepidocrocite) and aluminum oxyhydroxide (boehmite). They are widely used in catalysts, battery materials, pigments, water treatment, and ceramics due to their high surface reactivity and tunable structure. The supply chain starts upstream with metal ores (e.g., bauxite for Al, iron ore for Fe, laterites for Ni/Mn) and basic chemicals such as acids and alkalis. Midstream production involves controlled precipitation, hydrothermal synthesis, or oxidation processes to form oxyhydroxide powders or nanostructures, followed by filtration, drying, and surface modification. Downstream, these materials are integrated into applications such as lithium-ion battery electrodes (precursors for cathode materials), adsorbents in environmental remediation, catalysts in chemical processing, and functional fillers in coatings and advanced ceramics, with distribution handled by specialty chemical suppliers or directly by advanced materials manufacturers. In 2025, global Oxyhydroxide output was about 9.6 million tons with 13 million tons of capacity, average prices of USD 400-1,200 per ton, and gross margins around 26%.

United States market for Oxyhydroxide is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Oxyhydroxide is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

Europe market for Oxyhydroxide is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
