The global p-Anisoyl Chloride market size is predicted to grow from US\$ 17.44 million in 2025 to US\$ 22.84 million in 2032; it is expected to grow at a CAGR of 4.0% from 2026 to 2032.

p-Anisoyl Chloride (CAS No.: 100-07-2), also known as 4-methoxybenzoyl chloride, is a crucial intermediate in organic synthesis. It appears as a white to pale yellow crystalline solid or liquid; it possesses strong irritant and lachrymatory properties and decomposes upon contact with water or ethanol. It is widely utilized in the production of pharmaceuticals (such as Raloxifene and Aniracetam) and fine chemicals.

The primary upstream raw material is p-methoxybenzoic acid (anisic acid), which is converted into the acyl chloride through a reaction with thionyl chloride, phosphorus trichloride, or phosgene. Given the highly hygroscopic and corrosive nature of acyl chlorides, production costs are directly influenced by the prices of chlorinating reagents and environmental waste treatment expenses. The core focus of the midstream sector lies in controlling product stability and purity?factors that directly determine the yield achieved in downstream high-end synthesis applications. Downstream applications are predominantly directed toward the production of pharmaceutical intermediates.

In 2025, global sales volume is projected to reach the thousand-ton level, with an average selling price of approximately \$8,000 per ton. The industry's gross profit margin typically ranges between 20% and 30%.

United States market for p-Anisoyl Chloride is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
