## Abstracts

The global P-chlorophenol market size is predicted to grow from US\$ 153 million in 2025 to US\$ 204 million in 2032; it is expected to grow at a CAGR of 4.1% from 2026 to 2032.

P-chlorophenol, also known as 4-Chlorophenol, is a chlorinated phenolic organic compound with the molecular formula  $C_6H_5ClO$ . It refers to a phenol derivative in which the chlorine atom is substituted at the para position relative to the hydroxyl group on the benzene ring. It is typically supplied as a white to light-colored crystalline solid, has a phenolic odor, is slightly soluble in water, and is readily soluble in many organic solvents such as alcohols, ethers, and aromatic hydrocarbons.

In 2025, the global production of P-chlorophenol reached 95,600 tons, with an average selling price of US\$ 1,642 per ton. Industry gross margins are estimated at approximately 20%.

Asia, especially China and India, is expected to remain the major production and consumption region due to its strong agrochemical, pharmaceutical intermediate, and fine chemical manufacturing base. However, future growth will be constrained by the toxic and persistent nature of chlorophenols, stricter environmental regulations, wastewater treatment requirements, hazardous waste management, and occupational safety controls. As a result, market opportunities will increasingly focus on compliant and stable supply, high-purity and low-impurity grades, cleaner and more continuous production processes, customized downstream specifications, and long-term supply relationships with agrochemical and pharmaceutical intermediate customers.
