The global PA66 Engineering Plastics market size is predicted to grow from US\$ 6065 million in 2025 to US\$ 7290 million in 2031; it is expected to grow at a CAGR of 3.1% from 2025 to 2031.

Nylon (PA) 6 & 66 are both synthetic polymers called polyamides, with the numbers describing the type and quantity of polymer chains in their chemical structure. Most nylons, including 6 & 66, are semi-crystalline and possess good strength and durability for demanding applications.

Nylon 6 should be used if a lightweight engineering plastic is required to withstand high impact and stress. It has better aesthetic appearance than Nylon 66 due to its lustrous finish and is easier to dye. It is an ideal choice for applications in the automotive, industrial and military industries. Common applications include: gears, firearm components and automotive engine compartments. It is not ideal, however, for applications that are exposed to water at high temperatures due to its higher water absorption and lower heat deflection rate than Nylon 66, which would be a better choice.

Safety, low carbon and environmental protection have become the mainstream trends in the development of the global automotive industry in the 21st century. Engineering plastics are replacing metal materials and are gradually expanding from decorative parts to structural parts and functional parts. PA66 is an excellent engineering plastic with very stable chemical properties and excellent resistance to lubricants and gasoline. In the social context of energy conservation and emission reduction, the penetration

rate of PA materials in the automotive industry is gradually increasing due to its advantages in lightweight, heat resistance, oil resistance, flame retardancy and other aspects.
