The global Packaging for Medical Use market size is predicted to grow from US\$ 22140 million in 2025 to US\$ 27572 million in 2032; it is expected to grow at a CAGR of 3.2% from 2026 to 2032.

Packaging for medical use refers to specialized packaging systems designed specifically for medical devices, pharmaceuticals, and other medical products. These systems provide physical protection, maintain sterility, and ensure product safety and efficacy during transportation, storage, sale, and use. Their core functions far exceed those of ordinary packaging. They must provide a reliable sterilization barrier to prevent microbial intrusion, withstand rigorous sterilization processes, and ensure the stability of the contents within their shelf life. Furthermore, they must clearly label product information and assist in clinical use, making them an indispensable component of the entire medical product process. Their performance and quality directly impact patient safety.

The market outlook for packaging for medical use is robust and positive, with its growth closely linked to the continued development of the global healthcare industry. Key drivers include: increased healthcare demand due to a global aging population, rising consumption of pharmaceuticals and medical devices, and increasingly stringent global pharmaceutical and medical device regulations placing higher demands on packaging safety and traceability. The future development trend clearly points to ?more intelligent, more sustainable, and more human-centered?: intelligent packaging achieves full traceability and status monitoring by integrating technologies such as RFID and temperature sensing; green packaging adopts recyclable and biodegradable materials to cope with environmental pressures while ensuring performance; at the same time, human-centered design to improve medication safety and convenience will also become

an important direction for innovation.
