The report requires updating with new data and is sent in 48 hours after order is placed.

Vaccine provides protection against particular diseases by improving immunity. Vaccines are the biological preparations of weakened or killed microorganism, its surface proteins or its toxins.

The global paediatric vaccine market is expected to grow at a healthy CAGR in next few years.

Increase in growth would be primarily attributed to improved understanding of immunology, which has resulted in launch of new vaccines products. Technological breakthrough has led to development of new vaccine class such as DNA vaccines, vector vaccines, intranasal vaccines, mucosal vaccines and others.

However, manufacturing complexity and stringent regulatory compliance are the factors that hinder the market growth. Refusal to immunization and vaccines shortages are other restraints for this market.
