Painted steel is exactly that: a layer of paint is applied to steel, creating a protective layer from the elements. The process of applying paint to steel involves: Cleaning the steel using a technique called sandblasting. This also roughens up the surface, allowing the paint to bond better. Back painted glass is a unique use of glass that has been growing in popularity in recent years. It is essentially exactly what it sounds like- glass that has been painted on the back side. That way, from the front side, the glass is no longer translucent, but instead a solid colour. In a double-glazed unit the paint would be applied to surface four. The applications for back painted glass vary widely and it is commonly used in both residential and commercial buildings.
