In 2025, the global production of palm wax emulsifiers was approximately 85,000 tons, with an average selling price of around US\$3,280 per ton. Single-line production capacity is approximately 2,000-5,000 tons per year, with an average gross profit margin of 20-30%. Palm wax emulsifier is a surfactant extracted from natural palm wax, widely used in cosmetics, food, coatings, and industrial formulations. Its main function is to mix oils and water through emulsification, forming a stable emulsion. Palm wax emulsifier not only possesses excellent emulsifying capabilities but also improves product stability and texture, making it particularly suitable for formulations requiring high emulsification stability and environmental friendliness. It is typically derived from palm oil, aligning with the principles of green chemistry and sustainable development.

The upstream raw materials for palm wax emulsifiers mainly originate from petrochemicals and agricultural derivatives, including ethylene oxide, propylene oxide, and fatty acids used in the synthesis of surfactants, as well as the core raw material, natural palm wax. Its downstream applications widely cover multiple industrial and consumer sectors, primarily serving high-end cosmetics, food, leather finishing, coatings, automotive care products, food-grade fruit preservation coatings, and specialty finishing agents in the textile and paper industries, meeting market demand for environmentally friendly and high-performance surface treatment solutions.
