Abstracts

The global Pan-Hydrogen Gas Turbine market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A pan-hydrogen gas turbine is a gas turbine that can burn fuel mixtures containing different proportions of hydrogen and has a wide range of fuel adaptability. It can operate using a fuel combination ranging from pure natural gas to pure hydrogen, and promote the transformation of the energy industry towards low-carbon or zero-carbon by reducing or completely eliminating carbon emissions. This type of gas turbine has important potential in terms of efficient power generation and environmental protection, and has attracted much attention in the context of addressing climate change and achieving sustainable development.

The pan-hydrogen gas turbine represents an important step towards clean and sustainable development in the energy sector. With the global emphasis on carbon reduction and climate change, hydrogen energy has become the key to future energy transformation due to its zero-carbon emission characteristics. The pan-hydrogen gas turbine provides a smooth transition solution for existing gas-fired power generation technology by being compatible with natural gas and hydrogen mixed fuels. This not only helps to reduce carbon emissions, but also utilizes existing infrastructure to reduce the cost and risk of energy transformation. However, large-scale commercial use still faces many technical, economic and policy challenges, such as the construction of infrastructure for hydrogen storage and transportation and the tolerance of gas turbine materials.
