Abstracts

Paraben is white crystalline powder or colorless crystal, easily soluble in alcohol, ether and acetone, very slightly soluble in water, with a boiling point of 270-280°C. It is mainly used as a bactericidal preservative in organic synthesis, food, cosmetics, and medicine, and also as a feed preservative. Because it has a phenolic hydroxyl structure, it has stronger antibacterial properties than benzoic acid and sorbic acid. Its mechanism of action is to destroy the cell membrane of microorganisms, denature proteins in cells, and inhibit the activity of respiratory enzymes and electron transfer enzymes of microbial cells.
