The global Parallel Gear Reducers market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Parallel gear reducers are mechanical devices that are used to reduce the rotational speed and increase the torque of a power transmission system.

They consist of two parallel shafts, one connected to the input source (such as a motor) and the other connected to the output device (such as a conveyor or a pump). The input shaft transmits torque to the gears inside the gearbox, which in turn transmit power to the output shaft.
