Parallel shaft gearbox, also known as parallel gear reducer, is a gear transmission device consisting of two parallel shafts and gears, which mesh together to transmit power and provide deceleration. The gears can be helical, spur or helical gears, which are usually installed in a rigid housing for protection. Parallel shaft gearbox can be customized according to different torque and speed requirements. By changing the size and number of gears, the gearbox can provide different reduction ratios. This allows the gearbox to adapt to a wide range of applications. In addition to providing deceleration, a

parallel shaft gearbox can also be used to increase torque. By using the gear reduction mechanism, the transmission can multiply the torque output of the input shaft.
