Abstracts

The global Parking Controller market size is predicted to grow from US\$ 2588 million in 2025 to US\$ 7812 million in 2032; it is expected to grow at a CAGR of 17.4% from 2026 to 2032.

In 2024, global Parking Controller production reached approximately 7.55 million units, with an average global market price of around US\$ 300 per unit. The parking controller is an electronic device used to manage and control the parking function of the vehicle. It ensures the safety and stability of the vehicle under various parking conditions through functions such as automatic parking, electronic handbrake, parking brake and hill start assist. The device can monitor the braking status in real time, provide fault diagnosis and alarm, simplify the driver's operation, improve the convenience of use, and integrate with other vehicle systems to improve the overall intelligence level of the vehicle.

With the acceleration of global automotive electrification and intelligentization, parking controllers are becoming a core safety and comfort configuration in the vehicle's electronic architecture. Stringent emissions and safety regulations are driving manufacturers to continuously innovate in lightweight and integrated designs, enabling EPB systems to evolve from traditional mechanical parking brakes to electric-pneumatic integrated, software-defined intelligent braking. At the same time, the increasing adoption of new energy vehicles, autonomous driving, and connected car technologies is placing higher demands on EPBs for rapid response, vehicle energy recovery, remote diagnostics, and over-the-air (OTA) upgrades. Suppliers must not only deeply integrate with brake calipers, sensors, and body controllers but also provide configurable functional safety (ISO 26262) solutions to meet the diverse needs of passenger cars, commercial vehicles, and high-end luxury vehicles.
