The global Parking Cooler for Truck market size is predicted to grow from US\$ 802 million in 2025 to US\$ 1424 million in 2032; it is expected to grow at a CAGR of 8.4% from 2026 to 2032.

In 2025, global Parking Cooler for Truck production reached approximately 1.1 million units with an average price of USD \$760 per unit. Parking Cooler for Truck is a low voltage DC refrigeration assembly used to cool and dehumidify a truck cab or sleeper compartment when the main diesel engine is switched off. In market research terms, it is best positioned between commercial vehicle HVAC, truck aftermarket accessories, driver comfort equipment, and idle reduction systems. The product differs from belt driven driving air conditioning, diesel parking heaters, transport refrigeration units, RV air conditioners, and compressor components because it is sold as a complete battery powered cab cooling unit. Typical forms include rooftop integrated coolers, split sleeper air conditioners, rear wall mounted DC systems, and no idle cooling packages with battery protection. Its independent research value comes from the convergence of anti idling regulation, fuel saving pressure, driver rest quality, and electrification of commercial vehicle auxiliary loads.

Parking Cooler for Truck should be researched as a complete low voltage DC cab cooling system rather than as a generic vehicle air conditioner. Its defining feature is operation during parking without running the main diesel engine. The unit integrates a DC compressor, condenser, evaporator, fans, control board, refrigerant circuit, and battery protection logic into a rooftop, split, rear mounted, or auxiliary battery supported assembly. This boundary separates it from conventional belt driven driving air conditioning, transport refrigeration, RV rooftop air conditioners, diesel parking heaters, and standalone electric compressors. 2) Demand is supported by the practical

economics of long haul trucking. Drivers need cab and sleeper cooling during rest periods, while fleets and regulators increasingly dislike engine idling because it consumes fuel, creates emissions, increases engine wear, and worsens noise around truck stops or depots. Battery powered parking coolers provide a direct equipment response to this problem. They are especially attractive in hot climates, long distance freight routes, regions with strict anti idling rules, and fleets that value driver retention and rest quality. 3) The supply structure is split between global vehicle HVAC brands and highly competitive Chinese manufacturers. Premium brands emphasize reliability, vehicle grade design, low noise, battery management, and compatibility with fleet or OEM requirements. Chinese suppliers have expanded the low and mid price aftermarket through 12 V and 24 V rooftop and split units, often targeting trucks, vans, construction machinery, agricultural equipment, and special vehicles. This creates a wide price spread and makes weighted pricing necessary. Unit volumes are biased toward lower and mid priced aftermarket products, while premium systems raise total market value through higher selling prices and installation related configurations. 4) Growth should remain above ordinary commercial vehicle accessories but below the most aggressive electrification components. The product benefits from hotter summers, longer driver dwell time, anti idling enforcement, fuel cost sensitivity, and the wider use of auxiliary battery systems. Growth is also supported by electric and hybrid commercial vehicles, where auxiliary HVAC becomes more naturally integrated into the low voltage or high voltage energy architecture. Constraints include battery capacity limits, installation quality, roof structure compatibility, regional cooling load differences, and competition from electric APUs or truck stop electrification. 5) For market positioning, Parking Cooler for Truck is best analyzed as an aftermarket led equipment category with increasing OEM relevance.
