The global Parking Payment System market size is predicted to grow from US\$ 302 million in 2025 to US\$ 552 million in 2032; it is expected to grow at a CAGR of 8.5% from 2026 to 2032.

The Production is about 1500 k units. A parking payment system is a technical solution for managing and collecting parking fees. It allows users (usually drivers) to pay at parking locations (such as parking lots, roadside parking spaces, etc.) to use parking services. These systems usually include payment terminals, backend management systems, and user interfaces, which can realize multiple payment methods such as self-service payment and electronic payment, thereby improving the efficiency of parking services and reducing waiting time in queues.

Parking Payment Systems are expected to evolve toward unmanned operation, contactless payment, cloud-based management, and intelligent operation. Traditional manual payment and paper-ticket-based systems will gradually decline, while license plate recognition, ETC/RFID, QR code payment, mobile payment, and e-invoicing will become standard features. Future systems will be increasingly connected with smart parking platforms, commercial property management systems, and urban traffic management platforms, enabling multi-site operation, dynamic pricing, parking reservation, membership management, and operational data analytics. With the growth of electric vehicles, parking tolling systems will also be further integrated with EV charging, parking guidance, and energy management systems, forming a combined ?parking + charging + payment + operation? solution.
