The global Part-turn Actuators market size is predicted to grow from US$ 140 million in 2025 to US$ 169 million in 2031; it is expected to grow at a CAGR of 3.2% from 2025 to 2031.

A Part-turn actuator is a type of actuator, also known as a rotary actuator, that can only rotate left or right over an angle of maximum 300°. These hydraulic actuators operate at working pressures around 70 bar. Part-turn actuators are much smaller than cylinders and do not have any external moving parts. Part-turn actuators are mainly used for bunker slides, opening butterfly valves, and for push, pull, lift and mix operations.

A part-turn actuator is a device used to control mechanical devices such as valves, doors, gates, etc., and realizes part-turn motion through electric, pneumatic or hydraulic methods. This type of actuator is suitable for applications that require operation within a limited angle, such as opening or closing a valve, regulating flow or pressure, etc. Part-turn actuators are designed so that they can move within a limited angular range, usually between 0 degrees and 90 degrees. Part-turn actuators can be driven electrically, pneumatically, hydraulically, etc. Among them, electric actuators usually use electric motors, pneumatic actuators use air sources, and hydraulic actuators use hydraulic systems. The movement of part-turn actuators can be achieved by control signals, such as electrical, pneumatic or hydraulic signals. This makes operation and control more precise and programmable.
