Abstracts

The global Particulate Matter Testing market size is predicted to grow from US$ 1956 million in 2025 to US$ 3700 million in 2031; it is expected to grow at a CAGR of 11.2% from 2025 to 2031.

Particulate Matter (PM) testing refers to the process of measuring and analyzing the concentration of tiny particles suspended in the air. These particles, known as particulate matter, can vary in size and composition and can have various sources, including combustion processes, industrial activities, vehicle emissions, and natural sources like dust and pollen. Particulate matter is categorized based on the size of the particles, usually into PM10 (particles with a diameter of 10 micrometers or smaller) and PM2.5 (particles with a diameter of 2.5 micrometers or smaller).

There is a growing emphasis on real-time monitoring of particulate matter. Traditional sampling methods, while accurate, may have limitations in providing immediate data. Real-time monitoring allows for more dynamic and responsive management of air quality.
