The report requires updating with new data and is sent in 48 hours after order is placed.

Parylene is prepared by a vacuum vapor deposition process, and the active small molecules "grow" a fully conformed polymer film coating on the surface of the substrate, which has the performance advantages unmatched by other coatings. It can be applied to surfaces of various shapes, including sharp edges, cracks and inner surfaces.

Now, parylene is the best protective coating in electronic, aerospace and medicinal fields. In normal condition, most of protective coatings are liquid, but parylene is one kind of high pure powder called as dimer, without liquid phase.
