A passive 3D cinema system utilizes polarized glasses to create a 3D effect for viewers. The system works by projecting two separate images onto the screen simultaneously, each with a different polarization. The glasses worn by viewers have lenses with matching polarizations, allowing each eye to see a different image. This creates the illusion of depth and dimension, resulting in a more immersive viewing experience. Passive 3D cinema systems are commonly used in theaters and entertainment venues to provide a more realistic and engaging movie-watching experience.

The global Passive 3D Cinema System market size is projected to grow from US$ million in 2024 to US$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
