The global Passive In-Building Cellular Enhancement System market size is predicted to grow from US\$ 927 million in 2025 to US\$ 1702 million in 2032; it is expected to grow at a CAGR of 9.3% from 2026 to 2032.

A Passive In-Building Cellular Enhancement System (also known as Passive DAS, or Passive Distributed Antenna System) is a type of wireless communication solution used to improve mobile network coverage inside buildings. It works by distributing signals from external cellular towers to the interior of a building without the need for active amplification of the signals.

In a passive system, the cellular signals are captured from the external environment, typically by an external antenna (or donor antenna), and then routed through coaxial cables to a network of indoor antennas. These indoor antennas rebroadcast the signal throughout the building, improving cellular connectivity in areas where the external signal may be weak or non-existent.
