The global Passive Integrated Transponder Antennas market size is predicted to grow from US$ 16.63 million in 2025 to US$ 27.1 million in 2032; it is expected to grow at a CAGR of 7.4% from 2026 to 2032.

A passive integrated transponder antenna is an inductive device specifically designed to read PIT (Passive Integrated Transponder) tags. It activates the unpowered PIT tag by emitting a low-frequency electromagnetic signal (usually 134.2 kHz), causing it to transmit a unique identification code in reverse, thereby achieving identification and data collection of the target individual. This antenna is usually composed of a coil and can be embedded or installed in water channels, animal nest entrances, fences, fish ladders, or aquatic experimental tanks to achieve contactless, automated, and continuous data collection. Because PIT tags do not require batteries, are small in size, and have a long service life, this antenna system is widely used in professional scenarios such as wildlife tracking, aquaculture, ecological research, and migration monitoring. It has the characteristics of high stability, accurate identification, and strong environmental adaptability.

United States market for Passive Integrated Transponder Antennas is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
