PON comprises of one optical line termination (OLT) at the carrier's premises and numerous optical network units (ONU) near the end users. PON is ecofriendly and provide better bandwidth compared to copper based networks. PON provide higher efficiency as well as security, and uses packets which are larger as well as variable. In passive optical network, a single fiber can support 16-128 end users. One fiber can handle both the upstream and downstream data traffic. PON helps in reduced operating expenses as it involves shorter installation time, reduced power expenses and provide high reliability. PON with higher bandwidth helps telecom companies to provide faster data, voice, video and some other services. PON is enabling telecom operators to provide fiber to the home, fiber to the building, fiber to the cabinet, fiber to the premises and fiber to the neighborhood, unlike fiber to the business alone in the past. BPON, EPON, GPON and WDM-PON are major passive optical network structures.
