The global Passive Optical Network TAPs market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Passive Optical Network TAPs (Test Access Points) are essential components in fiber optic networks that allow for the monitoring and analysis of network traffic without disrupting the data flow. These devices passively split the optical signal into two streams: one continues along the original path, and the other is directed to a monitoring system. PON TAPs are widely used in telecommunications, data centers, and network infrastructure for real-time network performance monitoring, troubleshooting, and security assessments. As passive devices, they require no external power and have minimal impact on the signal quality, making them highly reliable and efficient for network management.
