The global Passive Optical Splitter market size is predicted to grow from US\$ 5131 million in 2025 to US\$ 9600 million in 2032; it is expected to grow at a CAGR of 9.5% from 2026 to 2032.

Passive Optical Splitter (POS for short) is a passive optical device used for optical signal distribution. It can divide an optical signal (usually from an optical fiber in an optical cable) into two or more optical signals according to a predetermined ratio and output them to different optical fibers respectively. Passive optical splitters play a key role in optical fiber communication systems, especially in optical fiber access networks (FTTx), which are used to distribute optical signals from the central office (Central Office) to various user terminals.

The passive optical splitter market has maintained steady growth over the past few years, and the market size continues to expand. With the rapid development of optical fiber communication technology and the increasing demand for network bandwidth, the demand for passive optical splitters continues to grow. It is expected that the market size will continue to grow in the next few years. In addition, technological innovation is an important factor driving the development of the passive optical splitter market. With the continuous advancement of optical communication technology, the performance and functions of passive optical splitters are also constantly improving. At present, passive optical splitters have realized a variety of product series with splitting ratios ranging from 1:2, 1:4 to 1:64, which can meet the needs of different application scenarios. At the same time, with the development of silicon photonics technology, passive optical splitters based on silicon photonics are gradually being applied, which have the advantages of high integration, low cost, and compatibility with traditional electronic devices. In short, the passive optical splitter market has broad development prospects

and huge market potential.
