Passive optical TAPs (Test Access Points) are critical components in high-speed networks, allowing for the monitoring and analysis of data traffic without disrupting network performance. These devices passively split optical signals, sending one part to the live network and the other to monitoring tools for real-time data capture and diagnostics. Since they do not require power and introduce minimal signal loss, passive optical TAPs are ideal for high-speed environments like data centers and telecommunications infrastructure. They ensure accurate network monitoring while maintaining the integrity and performance of the original network.
