Passive radiative cooling film is an advanced material designed to reduce temperatures by reflecting sunlight and emitting thermal radiation. This film works without the need for external energy input, utilizing its highly reflective surface to deflect incoming solar radiation while simultaneously emitting infrared radiation to dissipate heat into the colder atmosphere or outer space. Such cooling films are often made from multilayer polymers or other advanced materials that enhance their thermal performance. Applications include improving the energy efficiency of buildings by reducing air conditioning needs, protecting electronic devices from overheating, and even cooling solar panels to enhance their efficiency. The technology offers a sustainable and energy-efficient solution for managing heat in various settings.

The global Passive Radiative Cooling Film market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
