The global Passive Seismic Monitoring Service market size is predicted to grow from US\$ 321 million in 2025 to US\$ 454 million in 2032; it is expected to grow at a CAGR of 5.1% from 2026 to 2032.

Passive Seismic Monitoring Service is a specialized geophysical and engineering service that systematically records, processes, and interprets naturally occurring or human-induced seismic waves without actively generating artificial seismic sources, enabling real-time or retrospective characterization of subsurface activity, stress changes, and geological structures. This service deploys networks of highly sensitive seismic sensors—including surface seismometers, downhole geophones, and fiber-optic distributed acoustic sensing (DAS) systems—to capture low-magnitude microseismic events (typically magnitude -2 to 3) and larger natural earthquakes, then leverages advanced data acquisition platforms and AI-driven analytical tools to locate event hypocenters, calculate seismic wave velocities, determine focal mechanisms, and map subsurface fracture propagation or stress redistribution.

United States market for Passive Seismic Monitoring Service is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
