The global Passive Sensor market size is predicted to grow from US\$ 38830 million in 2025 to US\$ 64980 million in 2032; it is expected to grow at a CAGR of 7.8% from 2026 to 2032.

Passive sensor? is a sensor that does not require external energy and achieves measurement by detecting changes in the physical or chemical properties of the measured object itself. The working principle of passive sensors is based on the capture and conversion of environmental signals. When the sensor material is subject to changes in sensing parameters (such as temperature, pressure, light, etc.), it will produce corresponding changes in physical quantities. These changes in physical quantities are converted into digital or electrical signals for output through changes in the internal and external electric field distribution of the material, changes in charge caused by vibration, etc. Passive sensors have the advantages of simple structure, low cost, high reliability, and easy maintenance, so they have been widely used in many fields.

United States market for Passive Sensor is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
