Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Passive Tuned Mass Damper market.

Passive Tuned Mass Damper is a passive structural vibration control device. It mainly reduces the vibration of the structure by installing an additional mass vibrator on the structure. A passive tuned mass damper does not require an external energy source or control system to work, it uses the structure's own vibration to dissipate energy, thereby reducing the vibration amplitude of the structure.

Passive tuned mass dampers have been widely used in various structures such as buildings, bridges, and wind power towers, which can effectively reduce the structural response and improve the seismic performance and comfort of the structure. Due to its

simplicity, reliability, and no need for external energy sources and control systems, passive tuned mass dampers have become one of the commonly used devices in the field of structural vibration control.
