Passport and ID scanner is a device that is used to capture and read the information stored in the machine-readable zone (MRZ) of passports and IDs. The MRZ is a series of characters that are printed in a specific format on the bottom of the personal information page of passports and the front or back of IDs. The information stored in the MRZ includes the holder's name, date of birth, passport or ID number, and expiration date. Passport and ID scanner can be used for various purposes, such as identity verification, border control, and security screening. It is commonly used in airports, government agencies, financial institutions, and other organizations that require accurate and efficient verification of identity documents.

The global market for passport and ID scanners is driven by increasing security concerns, advancements in technology, and the need for efficient and accurate identity verification. The rising threat of identity theft, forgery, and document fraud has led to a growing demand for advanced ID scanning solutions that can accurately verify the authenticity of identification documents. The shift towards digitalization and the integration of biometric data in identification documents are driving the demand for passport and ID scanners with biometric capabilities, such as fingerprint and facial recognition. Stringent security measures at border crossings, airports, and government institutions drive the adoption of advanced passport and ID scanning technologies in North America. The European Union's focus on enhancing security and streamlining border control processes has led to the widespread adoption of passport and ID scanning solutions.
