The global Passport Reader market size is predicted to grow from US\$ 188 million in 2025 to US\$ 253 million in 2031; it is expected to grow at a CAGR of 5.1% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

A biometric passport is a traditional passport that has an embedded electronic microprocessor chip which contains biometric information that can be used to authenticate the identity of the passport holder. It uses contactless smart card technology, including a microprocessor chip (computer chip) and antenna (for both power to the chip and communication) embedded in the front or back cover, or center page, of the passport. The passport's critical information is both printed on the data page of the passport and stored in the chip.

Increase in the e-passports is rising the demand for passport readers at the airport terminals, hotels, and car rental service stations among others. These e-passports help in creating highly secure and interoperable infrastructure for international travel. Additionally, they reduce waiting time and benefit users by providing self-service kiosks, which enables the passengers to self-verify. However, one of the major restraining factors slowing down the growth of the passport readers market are the technical issues that occur in the device. The passport reader is an electronic device comprising electronic components, optical scanners, RFID, and others. Electronic components are highly sensitive to high voltage, which may damage them or may interfere with the proper working of the device.
