Patient recovery chair has been designed to fulfil the demands of today's healthcare processes in post-day surgery recovery. The chair is used instead of the traditional hospital bed in order to improve patient vitality during recovery. Patient recovery chairs omit a series of negative consequences such as muscle waste, bed sores and mental deterioration as well as preserve muscle mass as they allow a more complete breathing than alternative beds. The patient recovery chair is not just any standard set of sitting tool but it requires deep patient satisfaction in order to make it of some use.
