The working principle of the detector is that the photons incident on the polycrystalline film will promote the electrons to pass through the band gap, thereby increasing the conductivity of the material, thereby reducing the resistance of the material. The polycrystalline lead sulfide (PbS) unit detects radiation with a wavelength range of 1 to 3.3 microns, and shows higher sensitivity than the polycrystalline lead selenide (PbSe) can detect radiation between 1 to 5.2 microns.
