Prestressed Steel Bar/Strand/Wire is a steel material used for prestressed concrete structures. Prestressed steel bars are high-strength steel materials. They enhance the crack resistance and bearing capacity of concrete by pre-applying tensile force. They have high strength, low relaxation, good weldability, and upsetting properties. They are used in prestressed components such as centrifugal pipe piles, electric poles, viaduct piers, and railway sleepers. Prestressed steel strands are twisted steel cables composed of multiple high-strength steel wires. After stress relief treatment (stabilization treatment), they have ultra-high strength, low relaxation, and corrosion resistance. They are used in cable-stayed bridges, suspension bridges, tunnels, airports, hydropower stations, large-span buildings, nuclear power projects, etc. Prestressed steel wires are high-strength steel wires made of high-carbon steel wire rods through cold drawing or heat treatment. They have high elastic limit, good ductility and corrosion resistance. They are mainly used in bridges, highways, railway sleepers, high-rise buildings, etc.
