## Abstracts

The global PC Diffuser Sheet market size is predicted to grow from US$ 397 million in 2025 to US$ 577 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

PC Diffuser Sheet is a solid functional optical sheet, typically within a thickness range of 0.80–12.00 mm, manufactured primarily from polycarbonate resin and engineered to redistribute incident light through bulk-dispersed light-diffusing particles, textured optical surfaces, or a combination of both. It converts concentrated light from point or linear sources such as LEDs into a more uniform luminous field, suppressing visible hot spots and glare while maintaining a controlled level of light transmission. Unlike conventional opal-white polycarbonate sheet, PC Diffuser Sheet is specifically engineered to balance light transmission, haze, diffusion efficiency, and light-source hiding power, and is primarily used in LED luminaires, illuminated signage and light boxes, architectural and commercial lighting, transportation lighting, and other optical components requiring high impact resistance, thermal stability, or flame-retardant performance.

In 2025, global PC diffuser sheet sales are estimated at 70,000 tons, with a weighted average selling price of approximately US$5.80 per kilogram from manufacturers, and a gross profit margin of 24%–30% for the industry.

The primary upstream materials for PC Diffuser Sheet include polycarbonate resin, light-diffusing agents or diffuser masterbatches, UV stabilizers, flame retardants, and color and processing additives; manufacturers compound and melt-extrude these materials through flat-die extrusion, calendaring, and, where required, surface texturing or co-extrusion before supplying the finished sheets to LED luminaire, illuminated signage and light-box, architectural and commercial lighting, transportation lighting, and other industrial optical-component manufacturers.
