A PC (Prestressed Concrete) steel bar is a high-strength steel bar used in pre-stressed concrete to enhance its tensile strength. These bars are pre-tensioned to apply compressive force to concrete, increasing the overall strength of the structure. They are typically stressed to about 80% of their yield point.

In manufacturing, the steel is drawn into wires, heat-treated for required mechanical properties, cut to specified lengths, and subjected to thread rolling. Chemical composition typically focuses on three elements: phosphorus (P), sulfur (S), and copper (Cu).

The global PC Steel Bar market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
