A multilayer PCB is a type of PCB that consists of more than two conductive layers (typically three or more) separated by insulating layers. The conductive layers are connected to each other by vias, which are small holes that are drilled through the board and then plated with copper to create an electrical connection between the layers.

Multilayer PCBs are commonly used in complex electronic devices that require a high

degree of functionality in a small form factor, such as smartphones, tablets, and computers. They offer several advantages over single-layer or double-layer PCBs, including higher circuit density, better signal integrity, and improved thermal performance.

Designing and manufacturing multilayer PCBs is a complex process that requires specialized knowledge and equipment. The process involves laminating multiple layers of copper and insulating materials together, drilling holes for vias, and then etching and plating the conductive layers. The resulting PCB can be customized with various components and circuitry to meet the specific needs of the device it will be used in.
