The global PCB Cooling Buffer market size is predicted to grow from US$ 104 million in 2025 to US$ 149 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

The PCB cooling buffer machine is used for SMT or coating production lines and has two main functions. 1. Relieve the production speed issue of front-end and back-end devices. If the front-end devices are too fast or the back-end devices have abnormalities, resulting in product PCBA or PCB accumulation, the temporary storage machine can automatically store the products produced by the front-end devices, balance the speed of the front-end and back-end machines, and play a buffering role in the production speed of the front-end and back-end devices. 2. Temporary storage function: In the dispensing/coating production line, after dispensing or applying glue to PCBA, set the buffer time of the temporary storage machine and implement a first in first out mode for PCBA. The product is naturally dried (cured) through the temporary storage machine

United States market for PCB Cooling Buffer is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
