The global PCB Dust Cleaner market size is predicted to grow from US\$ 431 million in 2025 to US\$ 546 million in 2032; it is expected to grow at a CAGR of 3.2% from 2026 to 2032.

In 2025, global PCB Dust Cleaner production reached approximately 130 k units with an average global market price of around US\$ 3,400 per unit, and a gross profit margin of approximately 20%-40%. PCB Dust Cleaners are inline or standalone cleaning systems used in PCB and PCBA manufacturing to remove surface dust, fibers, and micro-particles before critical processes such as solder paste printing, coating, marking, inspection, or lamination. They typically combine contact cleaning rollers or brushes with vacuum suction, air knives, and optional ionization to reduce static attraction. By improving board surface cleanliness, they help reduce print defects, coating voids, optical inspection false calls, and contamination-related reliability issues. These machines support stable yield and process consistency in high-mix electronics production. The industrial chain of PCB Dust Cleaners includes upstream components such as vacuum blowers, filters, dust collection modules, brushes/rollers, antistatic ionizers, sensors, conveyors, motors, PLC controllers, HMI panels, sheet-metal frames, and ESD-safe materials. The midstream covers mechanical integration, airflow and vacuum design, control software, safety enclosure design, and factory testing for cleaning performance and particle capture efficiency. Downstream users include PCB fabrication, SMT/EMS assembly lines, automotive electronics plants, and high-reliability electronics manufacturing. Supporting services include installation, line integration, preventive maintenance, consumables replacement, and process tuning.
