Gold Plating is the process of placing a gold plate over other metal on a PCB to help it conduct electricity. Gold plating is the most common method of depositing gold onto a PCB and is a relatively simple technique. It works by producing a gold plating solution composed of a large number of gold ions. Gold ions are gold atoms that are missing at least one electron. The gold solution is applied to another surface with positively charged atoms (called the cathode), causing negatively charged atoms to chemically bond with them. This process creates a very thin layer of gold on the gilded surface—less than 15 millionths of an inch thick.
