## Abstracts

The global PCB Liquid Photoimageable Solder Resist Ink market size is predicted to grow from US\$ 526 million in 2025 to US\$ 849 million in 2032; it is expected to grow at a CAGR of 7.1% from 2026 to 2032.

PCB liquid photoimageable solder resist ink (LPI) is a photoimageable liquid polymer coating—commonly a two-component, epoxy-based system that can be aqueous-alkaline developable—applied by screen printing, spray or curtain coating onto PCB surfaces. After tack-dry, it is UV-imaged and developed to create pad openings and fine solder dams, then finally cured (thermal and/or UV) into a permanent insulating protective layer, designed to prevent solder bridging and to withstand heat cycling, surface finishing processes, and environmental exposure.

Upstream inputs include base resins and reactive diluents/monomers (often epoxy-acrylate type systems), photoinitiators, pigments/fillers, solvents and additives, plus curing/crosslinking components. Downstream PCB fabs apply and image/cure the mask via screen printing/spray/curtain coating and DI/LDI exposure workflows.

In 2025, global PCB liquid photoimageable solder resist ink production reached approximately 100 k tons, with an average global market price is \$5,300 per ton.
